Wood Shavings .10 / cf
Bark Chips .15 / cf

Delivery: No

Supplies

Composting thermometers are available at most garden supply centers, feed stores and farm supply businesses.

A thermometer should read from 0°—200° F and have a probe of at least 18 inches long to reach deep into the pile.

Mortality Composting Site Monitoring Workbooks are available FREE from the Natural Resources Conservation Districts. Call 802-254-5323 ext 5 to order.

Workbooks help you track temperature, moisture and site conditions and provide a record of your compost management.

Why Compost?

It saves money as rendering pick-up fees have reached up to \$70/cow in some areas. Composting costs a farmer some time in labor and, if they are not available free, the cost of buying and transporting bulking agents.

It is safer for groundwater and surface waters. The heat and microorganisms of the composting process destroy many pathogens, such as harmful bacteria and viruses. If a carcass is buried or left for scavengers, these disease agents can reach well water or be carried into rivers, streams and ponds. Even grazing animals themselves can act as vectors spreading disease.

It is more biosecure than having a truck of dead animals coming onto your farm for a pick up or having dead animals stored near the farm waiting for transport. If your animal is diseased you will also be taking proactive steps to prevent the problem from spreading.

It is an easy process to master and uses equipment that is already available on most farms.
